## DIGITAL SIGNATURE ALGORITHM

AIM:

To implement Digital Signature Algorithm (DSA) using C.

ALGORITHM:

1. Get the prime number  $p$  and its divisor  $q$  from the user.
2. Get the value of  $h$  from the user.
3. Compute the value of  $g$ .
4. Get the private key  $x_a$  from the user.
5. Compute the user's public key  $y$ .
6. Get the per-message secret key  $k$  and hash value of message  $M$ .
7. Compute the value of  $z$  using  $g$ ,  $k$  &  $p$
8. Compute  $z \% q$  to get the value of  $r$
9. Compute the multiplicative inverse. 10. Compute the value of  $s$ .
10. Print the signature  $(r, s)$ .

PROGRAM:

```
#include <stdio.h> #include <math.h>
int power(int,unsigned int,int);
int multiplicativeInverse(int,int,int); int main()
{
int p,q,h,g,r,s,t,x,y,z,k,inv,hash;
printf("\nEnter prime number p and enter q prime divisor of (p-1): ");
scanf("%d %d",&p,&q);
printf("\nEnter h such that it greater than 1 and less than (p-1): ");
scanf("%d",&h);
//Compute g t = (p-1)/q;
g = power(h,t,p);
printf("\nEnter user's private key such that it is greater than 0 and less than q : ");
scanf("%d",&x);
//Computer user's public key
y = power(g,x,p);
printf("\nEnter user's per-message secret key k such that it is greater than 0 and less than q : ");
scanf("%d",&k);
printf("\nEnter the hash(M) value : "); scanf("%d",&hash);
//Signing. Compute r and s pair z = power(g,k,p);
```

```

r = z % q;
inv = multiplicativeInverse(k,q,p); s = inv * (hash + x * r) % q;
//Display
printf("\n*****Computed Values*****"); printf("\ng = %d",g);
printf("\ny = %d",y);
printf("\nGenerated Signature Sender = (%d, %d) \n",r,s);
}
int power(int x, unsigned int y, int p)
{
int res = 1; // Initialize result
x = x % p; // Update x if it is more than or equal to p while (y > 0)
{
// If y is odd, multiply x with result if (y & 1)
res = (res * x) % p;
// y must be even now y = y >> 1; // y = y/2 x = (x * x) % p;
}
return res;
}
int multiplicativeInverse(int a, int b, int n)
{
int sum,x,y; for(y=0;y<n;y++)
{
for(x=0;x<n;x++)
{
sum = a * x + b * (-y); if(sum == 1)
return x;
}
}
}
}

```

OUTPUT:

```

➔ ~ ./a.out
Enter prime number p and enter q prime divisor of (p-1): 1279 71
Enter h such that it greater than 1 and less than (p-1): 3
Enter user's private key such that it is greater than 0 and less than q : 15
Enter user's per-message secret key k such that it is greater than 0 and less than q : 10
Enter the hash(M) value : 123
****Computed Values****
g = 3
y = 3
Generated Signature Sender = (0, 62)
➔ ~ █

```

RESULT:

Thus, a C program is implemented to demonstrate Digital Signature Algorithm.
